Requirements

We will be using below mentioned tools/IDEs/packages/services for development and deployment purpose, and I request you to get them installed on the attendees machines before workshop commencement. This will save our time, and attendees will be able to implement the learning at the same time.

1. Node JS (we will be writing our backend/webhooks in Node)
2. Visual Studio Code (we will use this as IDE for writing both server and client side code)
3. MongoDB Compass (though we will be using Mongo Atlas as our DB, compass will be handy for importing/exporting json data).
4. Postman (we will test our web hooks and other POST requests from postman)
5. Heroku CLI (we will be hosting our webhooks on Heroku)
6. Attendees must have a gmail account (we need this for accessing services of Dialogflow).
